Graph Traversal Methods - Topics

- Why we need to traverse the graph?
- Traversing the graph using different techniques
 - ✓ Depth First Search and Breadth First Search Traversal
- Algorithms for Depth First and Breadth First Search Traversal

Graph Traversals

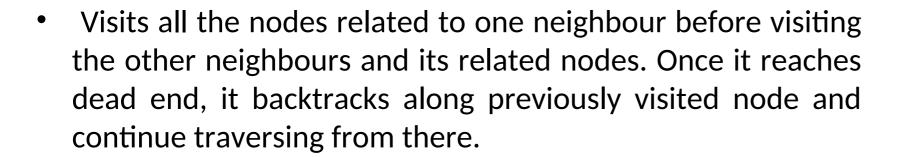

- Graph traversal(also known as graph search) refers to the process of visiting/investigating (checking or updating) each vertex of the graph in some systematic order -Wiki
- Traversal can start in any arbitrary vertex
- Traversals are classified by the order in which the vertices are visited

Methods to Traverse the Graph

- Depth First Search
- Breadth First Search

Depth first search (DFS)

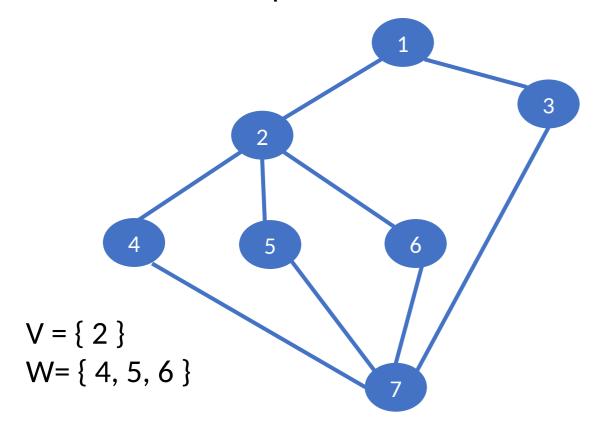

- Analogues to pre-order traversal of an ordered tree
- Uses stack behaviour, hence implemented using recursive algorithm

Depth First Search Traversal

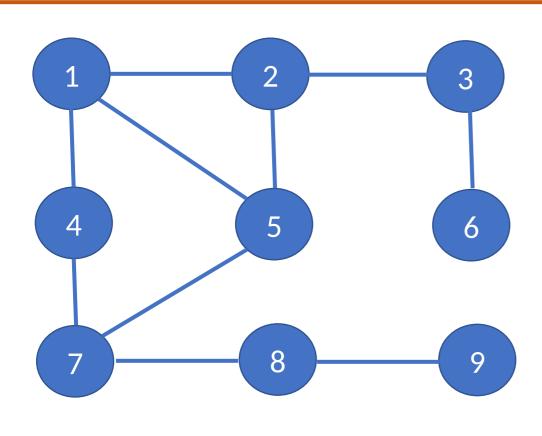

☐ DFS traverse the depth of the graph, until it cannot go any further at which point it backtracks and continues

Traversal order: 1, 2, 4, 7, 3, 5, 6

Depth First Search Traversal

Difficulties in the graph traversals

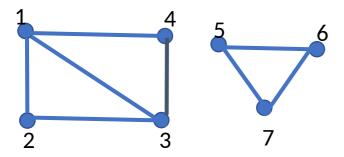

Graph may contain cycles

- Traversal algorithm may reach the same vertex second time.
- To prevent the infinite recursion, we introduce Boolean valued array visited
- Set the visited[v] to true once node v is visited
- Check the visited[w] before processing any node w

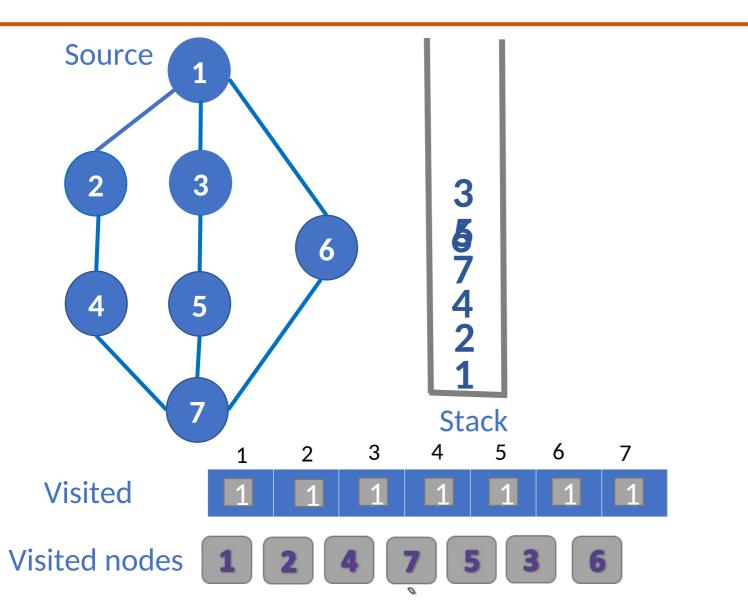

Graph may not be connected:

Traversal algorithm may fail to reach all the nodes from a single starting point

DFS Traversal - Using Stack

Breadth first search (BFS)

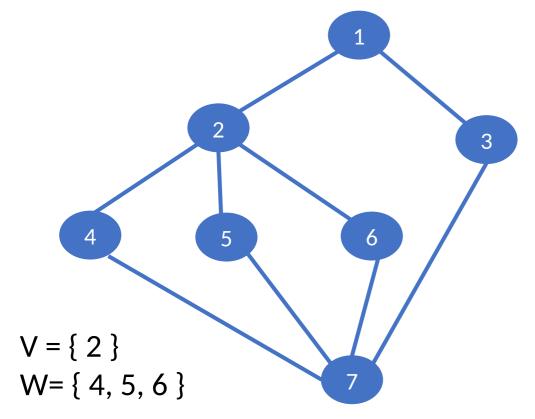

PES UNIVERSITY ONLINE

- Explores all the neighbour nodes in first level from an arbitrary node, before moving to next level of neighbouring nodes.
- Uses Queue behaviour

Breadth First Search Traversal

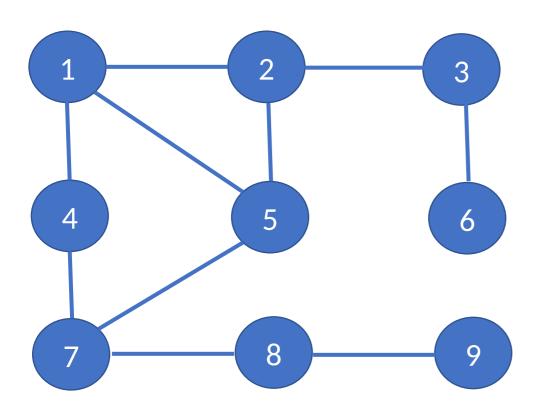

☐ Analogous to level-by-level traversal of ordered tree

Traversal order: 1, 2, 3, 4, 5, 6, 7

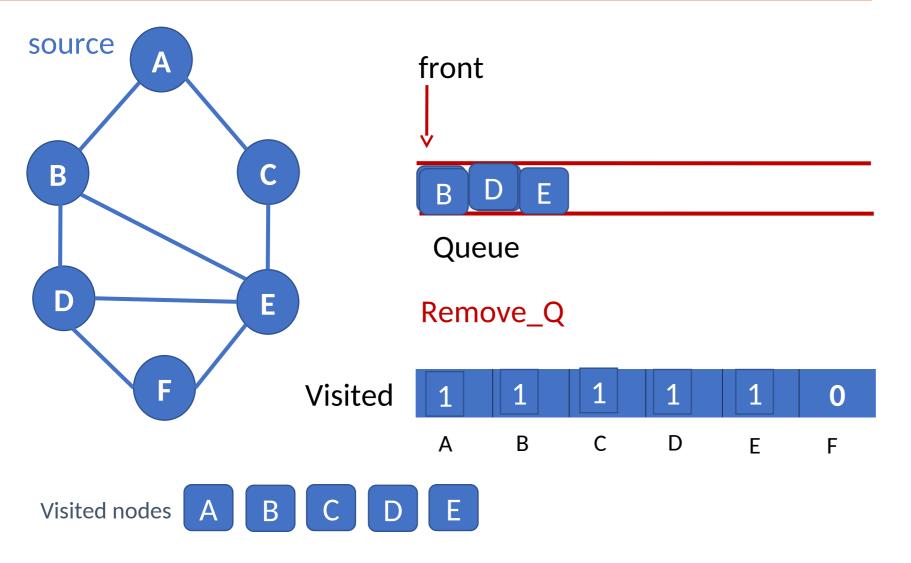

Breadth first search Traversal

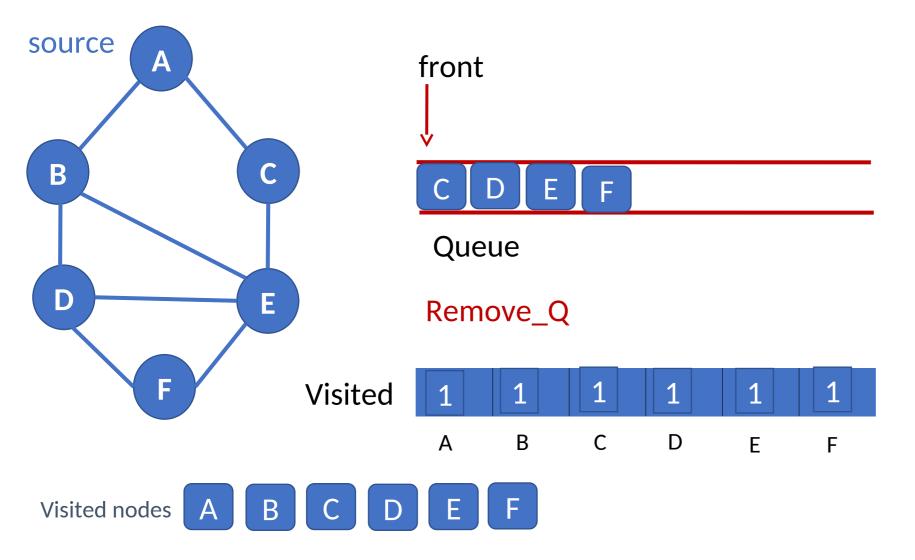

1 2 4 5 3 7 6 8 9

BFS Traversal - Using Queue

BFS - Traversal - Using Queue

DFS - Algorithm

```
Algorithm DFS (Graph G )

//Implements DFS traversal for given graph

// Input Graph G = (V, E)

//Output Graph G with vertices marked as visited

mark each vertex in V with 0 as a mark of being "unvisited"

for each vertex v in V do

if v is marked with o

dfs(v)
```

```
dfs(v)
// visits recursively all the unvisited vertices connected to
  vertex v by a path
For each vertex w in V adjacent to v do
  if w is marked with o
    mark w as visited
  dfs(w) Courtesy: "Introduction to Design and Analysis of Algorithms" By Anany Levitin
```

BFS - Algorithm

```
Algorithm BFS (Graph G )

//Implements BFS traversal for given graph

// Input Graph G = (V, E)

//Output Graph G with vertices marked as visited

mark each vertex in V with 0 as a mark of being "unvisited"

for each vertex v in V do

if v is marked with 0

bfs(v)
```

BFS - Algorithm

```
PES
UNIVERSITY
ONLINE
```

```
bfs(v)
// visits recursively all the unvisited vertices connected to
  vertex v by a path
While the queue is not empty
  for each vertex w in V adjacent to front vertex do
    if w is marked with 0
      mark w as visited
      add w to queue
      remove the front vertex from the queue
```
